

```
/*
switch (expr) {
  case SOMEVALUE:
    //statements;
    break;
  case ANOTHERVALUE:
    //statements;
    break;
  default:
    //statements;
    break;
}
break; is optional; however, it is usually needed, since otherwise code execution will continue
to the body of the next case block.
Add a break statement to the end of the last case as a precautionary measure, in case
additional cases are added later.
Strings literal values can also be used for the case values.
Expressions can be used instead of values.
Case default: is optional.
Braces are required.
```

JavaScript provides four logical operators:

```
unary negation (NOT = !a)
binary disjunction (OR = a || b) and conjunction (AND = a && b)
ternary conditional (c ? t : f)
```

In the context of a logical operation, any expression evaluates to true except the following:

```
Strings: "", '',
Numbers: 0, -0, NaN,
Special: null, undefined,
Boolean: false.
*/
```

```
var a = 3;
switch (a) {
  case 5:
    document.write('case 1 meet');
    break;
  case 3:
    document.write('case 2 meet');
    break;
  default:
    document.write('No cases met');
    break;
}
```
