

Web Design Tools and Resources Get your ideas on paper, design first to save reworking later!

Wireframes are like blueprints for the design process. After you map out your website navigation which gives you an idea of the pages you will need you need to begin to determine what you will need in your web page as content.

Wireframes help you visually how the website will look and feel. This allows you to place important content and ensure that it will be visible. When creating a mockup you need placeholder text and images if the real ones are not yet available. This will help determine what will be required to complete the site.
